TTL Loupes

Overview | Tech Specs | Photos

Admetec TTL (Through The Lens) loupes are the best choice for personal use. These loupes
are designed to integrate ergonomics and efficiency. Dentists and surgeons would enjoy using these loupes that provide overall comfort
and an especially convenient neck posture of a user. Each pair of loupes is manufactured according to personal requirements (such as IPD, working distance, eyesight prescription). Magnification available: 2.5x (the best choice for general dental treatment as it provides a good amount of magnification without a decrease in either focal depth or brightness; wide field of view – 120-140mm) and 3.2x (recommended for microsurgery; higher level of magnification implies a significant decrease in the depth-of-field and field size (50-60mm). We would offer you loupes optimal for your individual purposes (general or microsurgery) and demands (colour, frame, eye prescription).

In TTL loupes binoculars are closer to the practitioner's eyes and therefore they provide a wider field of view than a similar magnification Flip-up loupes
